

GOING REMOTE?

Three reasons why NetMotion makes sense

1

It keeps you and your team secure

According to Verizon's 2020 MSI Report, 39% of companies suffered a security compromise in the last year. This is up from 33% in 2019 and 27% in 2018. Without proper protection in place, working remotely can greatly increase your team's risk of a security attack.

NetMotion not only provides military-grade encryption of all data, but it also gives your IT team complete visibility and control of your mobile fleet. Rest assured, no matter what device you're working on or which network you're connected to, NetMotion is keeping your data safe.

2

It's simple to deploy

Ever deployed a legacy VPN solution? It can be a hassle, to put it mildly. Ensuring 100% adoption is something most companies struggle with, even in ideal situations where all devices are within the four walls of the office.

NetMotion makes it easy. With multiple options for seamless deployment, either through your current UEM solution or via an e-mail sent out to the mobile workforce, pushing the solution out is one less thing your team has to worry about.

3

It actually improves the user experience

The challenge with legacy VPNs is that many of them fail to support the basic needs of a highly mobile workforce. Most require constant reauthentication, slow down network performance and present a long list of end user experience concerns.

NetMotion is instead designed to allow your team to stay securely connected in weak and constantly changing network conditions. It can maintain sessions even during total disconnects. It will eliminate connectivity hassles from your workday, once and for all.

Easily deploy a
secure VPN that was
designed with **mobile
workers in mind**
